

IR2130D

3-PHASE DRIVER

Features

- Hermetic
- Floating channel designed for bootstrap operation
Fully operational to +400V
Tolerant to negative transient voltage
dV/dt immune
- Gate drive supply range from 10 to 20V
- Undervoltage lockout for all channels
- Over-current shutdown turns off all six drivers
- Independent half-bridge drivers
- Matched propagation delay for both channels
- Outputs in phase with inputs

Description

The IR2130D is a high voltage, high speed power MOSFET and IGBT driver with three independent high and low side referenced output channels. Proprietary HVIC technology enables ruggedized monolithic construction. Logic inputs are compatible with 5V CMOS or LSTTL outputs. A ground-referenced operational amplifier provides analog feedback of bridge current via an external current sense resistor. A current trip function which terminates all six outputs is also derived from this resistor.

Product Summary

V_{OFFSET}	400V max.
I_O+/-	100mA / 100mA
V_{OUT}	10 - 20V
t_{on/off} (typ.)	675ns & 425ns
Deadtime (typ.)	0.9μs

An open drain **FAULT** signal indicates if an over-current or undervoltage shutdown has occurred. The output driver has a high pulse current buffer stage designed for minimum driver cross-conduction. Propagation delays are matched to simplify use at high frequencies. The floating channels can be used to drive N-channel power MOSFETs or IGBTs in the high side configuration which operate up to 400 volts.

Absolute Maximum Ratings

Absolute Maximum Ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to V_{SO}. The Thermal Resistance and Power Dissipation ratings are measured under board mounted and still air conditions.

Symbol	Parameter	Min.	Max.	Units
V _{B1,2,3}	High Side Floating Supply Absolute Voltage	-0.3	V _{S1,2,3} + 20	V
